

Pepin County Groundwater Nitrate Levels

Nitrate Levels

These results were compiled by the Pepin County Land Conservation & Planning Department. The data came from water tests done on homeowner's private wells between 2017 and 2021. The data was symbolized by PLSS section in order to protect the identity of homeowners. The data may not reflect the water quality of every well in the section. Levels below 2 mg/l are considered to be naturally occurring. Anything higher is considered to be from an outside influence. Nitrates levels above 10 mg/l are considered dangerous for human consumption.
