## Nitrate / Chloride

- Useful for understanding land-use impacts on groundwater

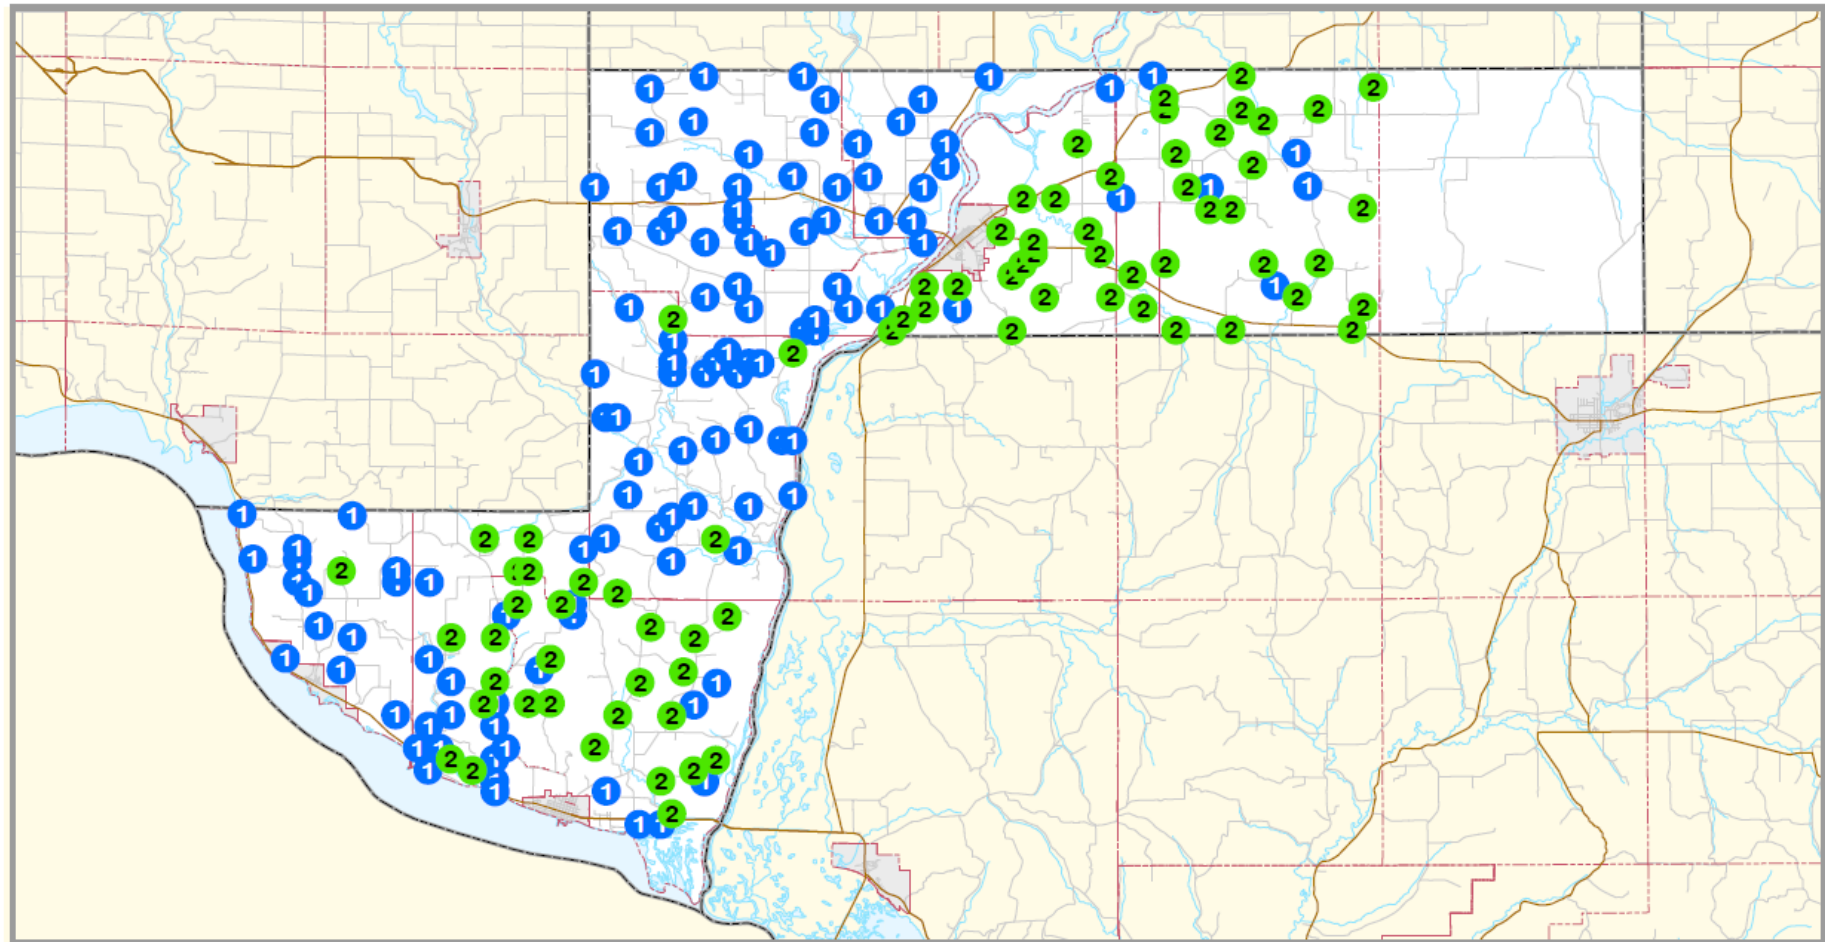

## Conductivity

- Overall water quality, combination of both land-use, rocks, and soils

## Total Hardness / Alkalinity / pH

- Help us understand how rocks and soils impact groundwater

# Pepin County Well Sampling Distribution

**Pepin County**  
County Wide, 2018-2024

**SAMPLE DISTRIBUTION**  
**NUMBER SAMPLES**

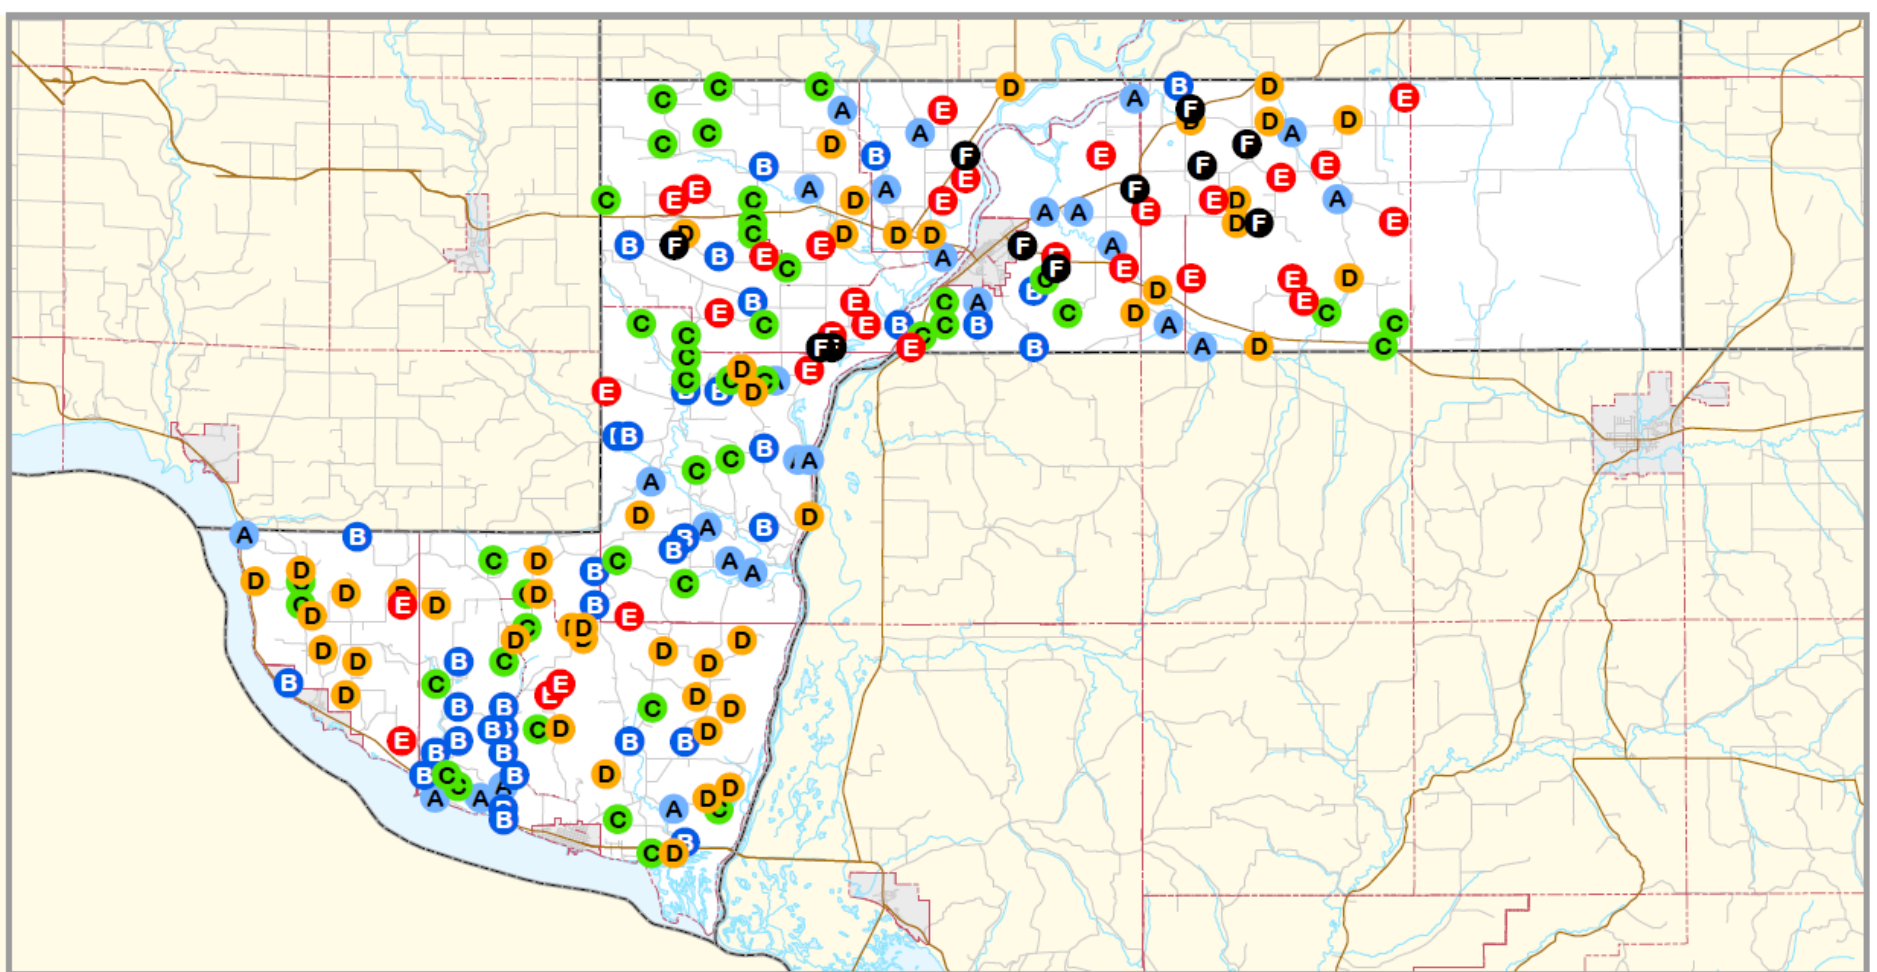

per 1/4 1/4 SECTION

- 1** 1
- 2** 2
- 3** 3
- 4** 4
- 5** 5 or more

University of Wisconsin - Stevens Point

# Pepin County Nitrate-N Concentration

## Pepin County County Wide, 2018-2024

### NITRATE-NITRITE (ppm N)

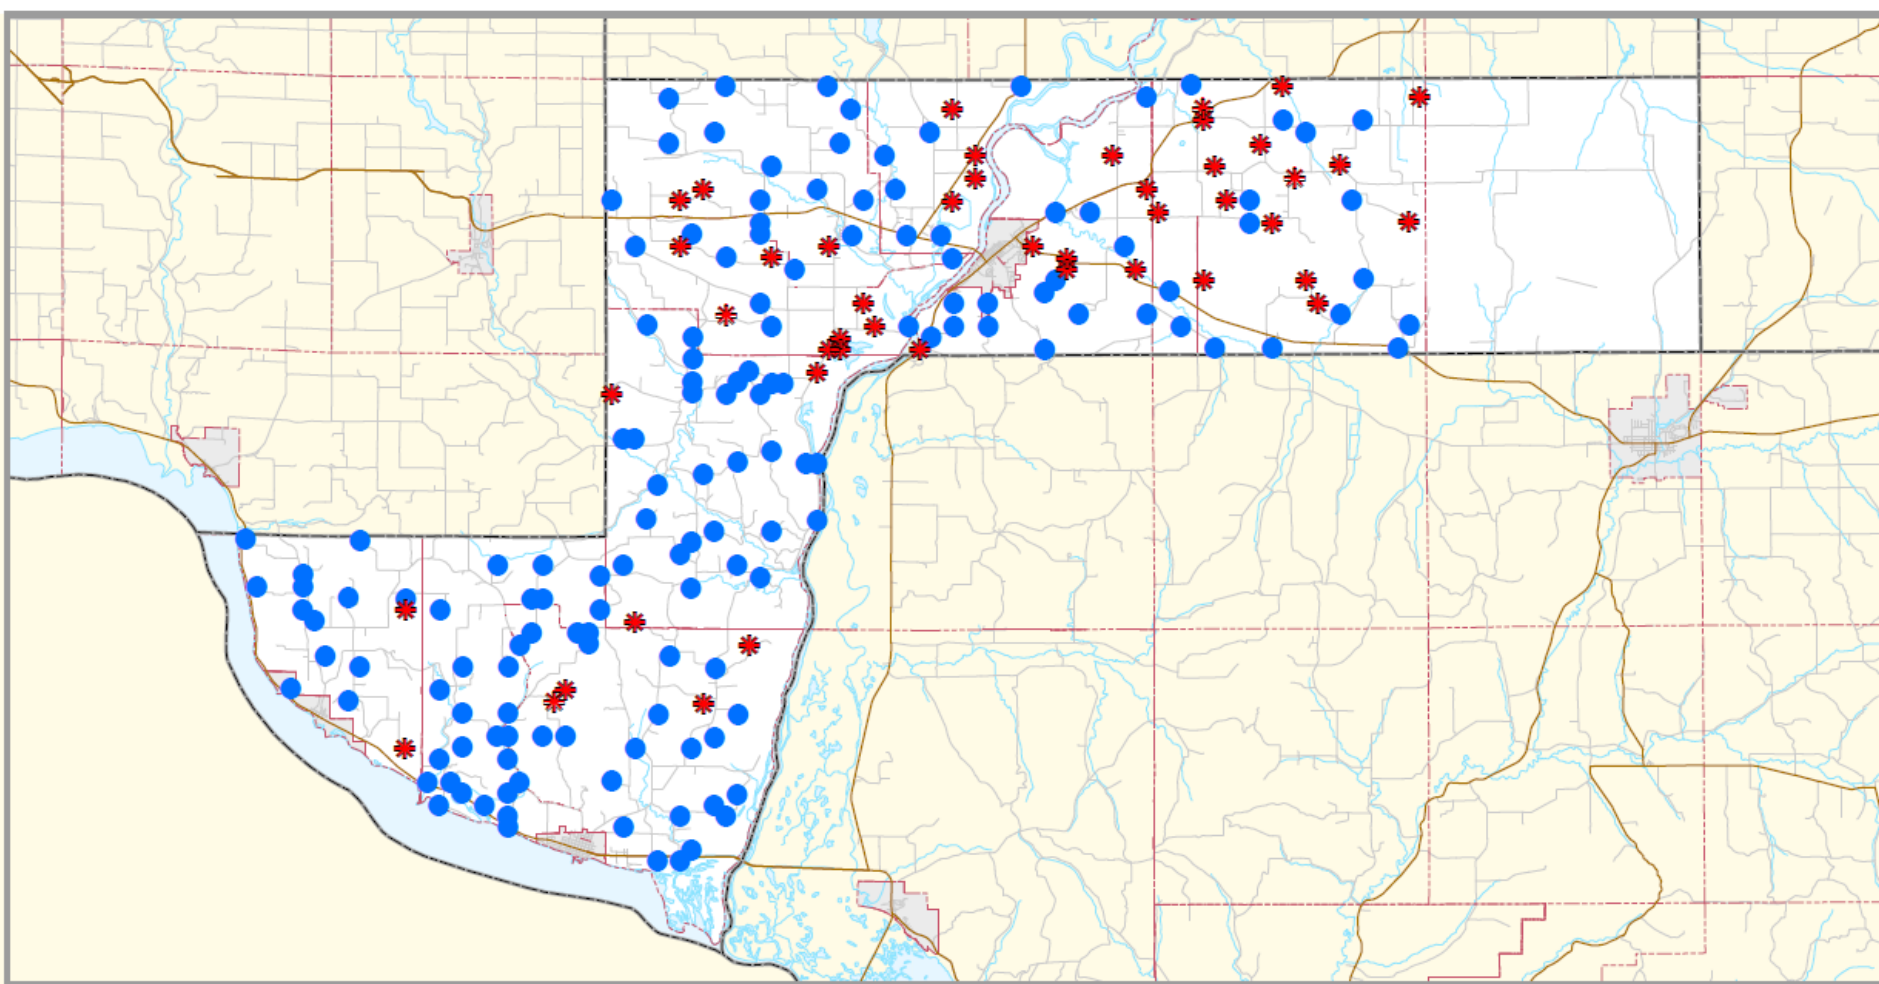

<b>A</b>	None Detected	38	14 %
<b>B</b>	... 2.0	45	17 %
<b>C</b>	2.1 - 5.0	60	22 %
<b>D</b>	5.1 - 10.0	68	25 %
<b>E</b>	10.1 - 20.0	42	15 %
<b>F</b>	20.1 ...	18	7 %

Mapped value is the average for the 1/4 1/4 section  
Treated samples not mapped

1550	0	0	0	0	0	2570	20.2	0	0	3	WASTEWATER ONLY

- 20/24 (83%) contained one or more Ag Tracers
- 13/24 (54%) contained only Ag Tracers
- 9/24 (38%) contained one or more Wastewater Tracers
- 7/24 (30%) contained both Ag & Wastewater tracers
- 2/24 (8%) contained only Wastewater tracers
- 2/24 (8%) contained detected no tracers

# Source Identification

- **Chemical Source Tracing (Ag vs. Wastewater)**

- Agricultural pesticides (metolachlor ESA, alachlor ESA) and compounds common to human wastewater (sucralose, acesulfame, caffeine, etc.) used to determine whether nitrate is coming from row crop agricultural systems or septic drainfields
- When both are present, cannot easily determine the percentage from each source
- In the case of agricultural nitrogen does not distinguish nitrate from fertilizer versus manure
- When only wastewater tracers are present nitrate concentrations were lower

- **Isotope Testing (Fertilizer vs. Manure)**

- Nitrogen from fertilizers, nitrification of commercial fertilizers/soil nitrogen, and manure/septic effluent have unique isotopic compositions that can be used to understand source
- Because nitrogen cycles within the soil, is often difficult to interpret
- More utility in in-field or edge of field monitoring where the isotopic signature is strongest

Figure 5. Measured  $\delta^{15}\text{N-NO}_3\text{N}$  versus  $\delta^{18}\text{O-NO}_3\text{N}$  compared to expected ranges from commercial fertilizer sources (dark blue dashed box), manure and septic sources (orange dashed box) and inorganic nitrate fertilizers (green box). Trend arrow of increasing  $\delta^{18}\text{O-NO}_3\text{N}$  and  $\delta^{15}\text{N-NO}_3\text{N}$  for enrichment due to denitrification. Ranges and arrow from (Kendall and Aravena, 2000).

Data from 2018 EPA investigation in Town of Armenia, Jackson County, WI.  
[https://www.epa.gov/sites/default/files/2018-10/documents/isotope\\_study\\_report\\_erg\\_csd-may\\_june2018.pdf](https://www.epa.gov/sites/default/files/2018-10/documents/isotope_study_report_erg_csd-may_june2018.pdf)

# Observing water quality changes

- **How long does it take to observe water quality impacts below a field?**

- Depends on soil type, geology, depth to water, when precip/snow melt happen (~Days to months)
- Are able to detect annual changes in groundwater quality at the very top of the aquifer

- **How long does it take to observe water quality in surrounding private wells?**

- Depends on distance, well/casing depth, geology, etc. (~1-10 years...educated guess)
- A rule of thumb is that groundwater in sand/gravel aquifers might move 1 foot per day
- The longer the water has to travel to reach a well the more potential mixing that occurs
  - Possibility of dilution from mixing with other land-uses
  - More difficult to interpret source tracing

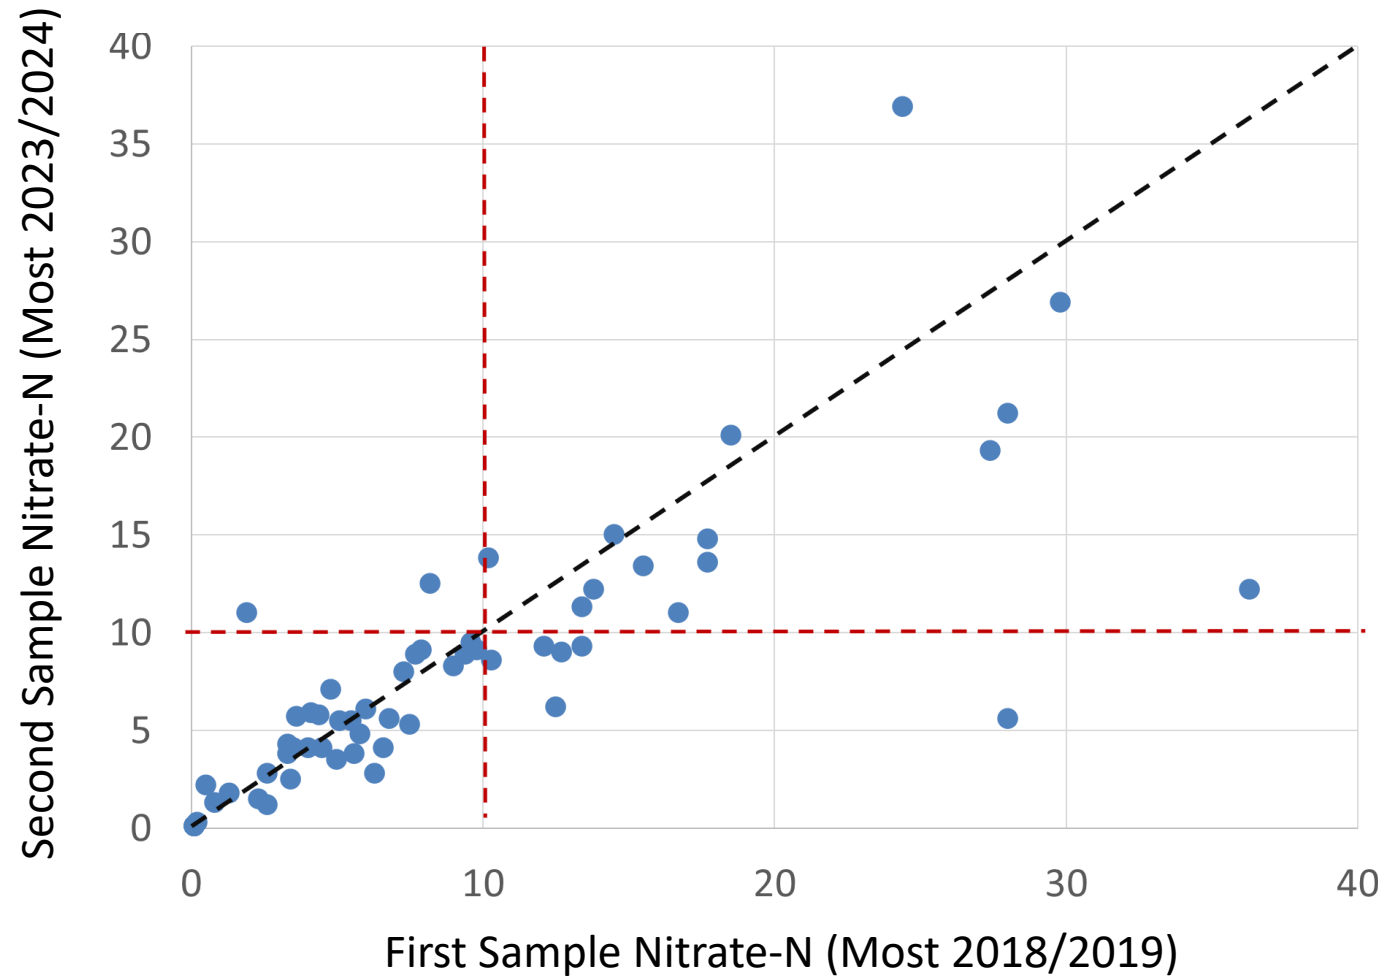

Ongoing work shows groundwater quality below potato years to have the greatest nitrate concentrations compared to other crops in the rotation

# Pepin County Preliminary Data Repeat Samples

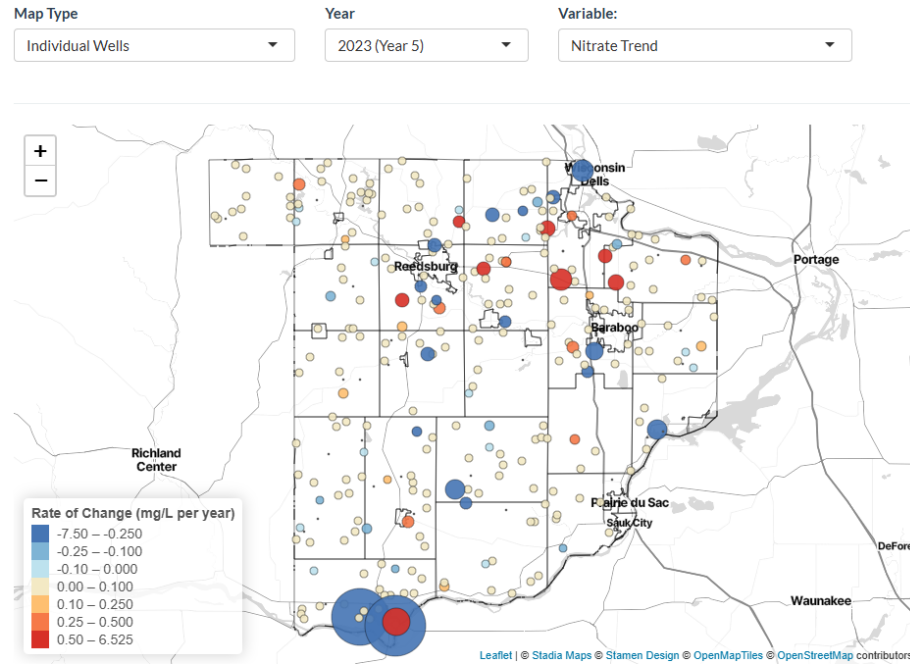

67 with repeat samples

- 33 decreased
- 11 no change
- 24 increased

# Trend analysis requires at least 4 samples, the more the better

## Sauk County Well Water Monitoring Project

Center for Watershed Science and Education in partnership with Sauk County  
Created by: Kevin Masarik, Abby Johnson, Grant Moser, and Jennifer Dierauer  
Last modified: May 20, 2024. [Contact us for questions](#)

[ABOUT the Project](#) | [LEARN about Tests](#) | [LEARN about other Variables](#) | [EXPLORE project data](#)

[County Trends](#) | [Individual Wells](#) | [Municipality](#) | [Wells, Geology, & Land Cover](#) | [Annual Summary Statistics](#)

### Investigate Water Quality by Individual Well

One of the major goals of the project is to understand variability in well water quality over time. By sampling the same wells annually, we can better understand whether water quality is different from one year to the next or relatively similar. If water quality is different, we can make assessments of whether those differences constitute an increasing or decreasing trend.

Well Water Project IDs have been assigned specifically for this project. If you are a participant and know your well's Project ID, you can select or enter from the drop-down menu. Otherwise if you are interested in learning about a particular point on the map, simply click on the point and enter that Project ID into the drop down menu. In order to maintain anonymity, Project IDs have only been shared with project participants for their individual well.

Select or enter a Project ID number:

80373

#### Nitrate-Nitrogen

Year	Nitrate-Nitrogen (mg/L)
2019	14.0
2020	14.0
2021	14.5
2022	15.0
2023	13.0

#### Chloride

Year	Chloride (mg/L)
2019	50.0
2020	50.0
2021	51.0
2022	49.0
2023	45.0

# Strategies to reduce nitrate in groundwater

- Applying fertilizer at the **right rate, time, source, place will maximize profitability and minimize excessive losses** of nitrogen to groundwater; additional practices may be needed to improve water quality in areas with susceptible soils and geology
- You may not need as much nitrogen fertilizer as you think, **conduct your own on-farm rate trials to develop customized fertilizer response curves for your farm**
- Utilize conservation incentive programs to **take marginal land or underperforming parts of fields out of production**
- **Diversify cropping systems** to include less nitrogen intensive crops in the rotation
- **Explore and experiment with the use of cover crops, perennial cropping systems, or managed grazing to reduce nitrate losses to groundwater**

# Long-term nitrogen reduction strategies for agricultural areas

	Practice	Details	% Nitrate-N Reduction (StDev)	Reduction potential	Uncertainty
Good	Timing	Fall to Spring Pre-plant	6 (25)	Low	High
		Spring pre-plant/sidedress 40-60 split compared to fall applied	5 (28)	Low	High
		Sidedress – Soil test based compared to pre-plant	7 (37)	Low	High
	Nitrification Inhibitor	Nitrapyrin – Fall – Compared to applied w/out nitrapyrin	9 (19)	Low	Medium
Better	Cover Crops	Rye	31 (29)	Medium	Medium
		Oat	28 (2)	Medium	Medium
Best	Perennial	Biofuel Crops (ex. switchgrass, miscanthus)	72 (23)	High	Medium
		Conservation Reserve Program	85 (9)	High	Low
	Extended Rotations	At least 2 years of alfalfa or other perennial crops in a 4 or 5 year rotation	42 (12)	Med-High	Low
